### **ACKNOWLEDGEMENTS**

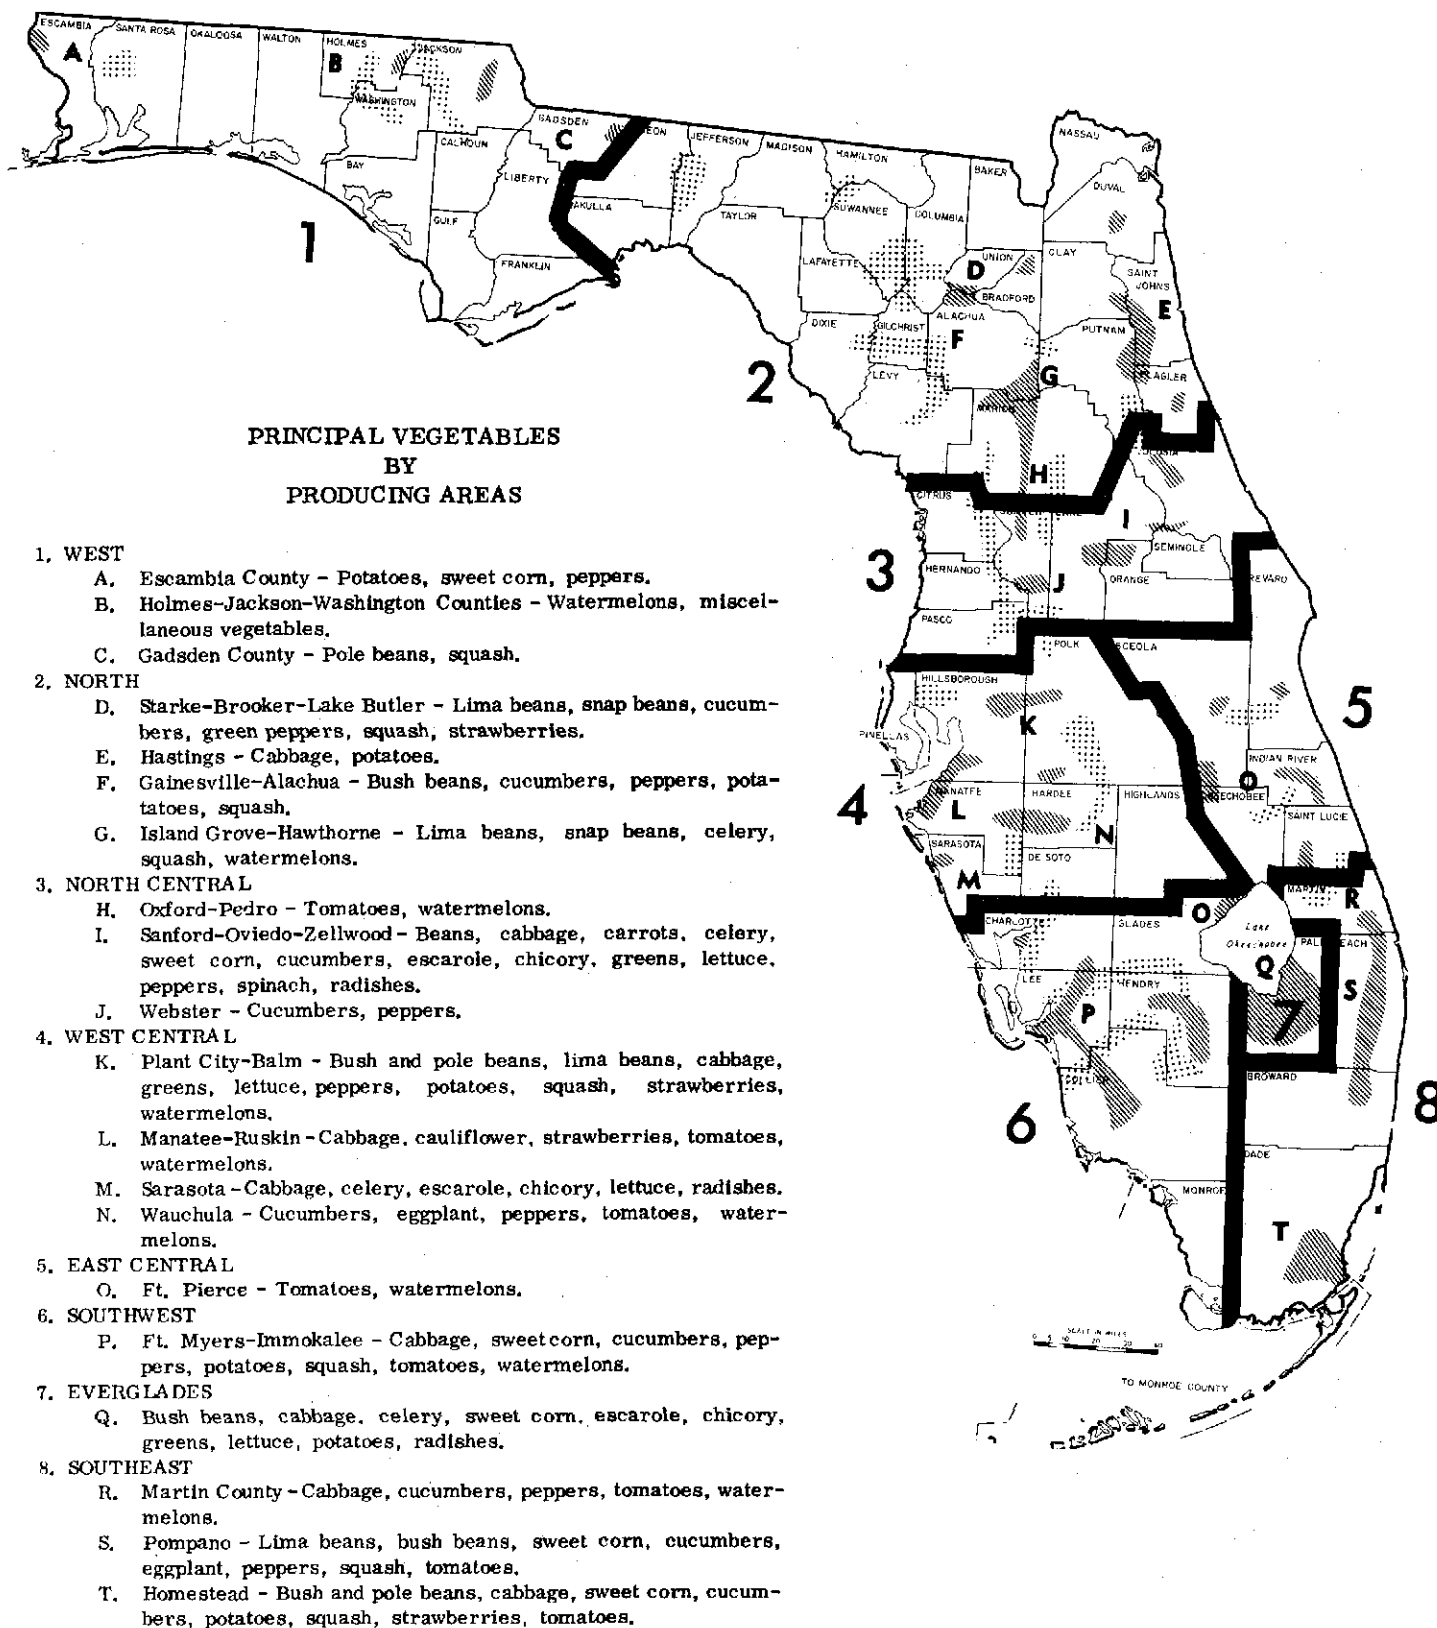

The acreage, production and value statistics in this bulletin are official State and USDA estimates prepared by the Florida Crop and Livestock Reporting Service. The county and area detail were made possible by the participation of the Department of Food and Resource Economics, University of Florida, in the estimating program. The State Markets Section of the Florida Department of Agriculture and the County Agents of the University of Florida's Extension Service, were also very helpful in supplying area and county information. Shipment statistics were provided by the Market News sections of the Florida Department of Agriculture and the USDA Agricultural Marketing Service.

Grower organizations have provided valuable assistance and data throughout the season. These groups include the Florida Celery Committee, Florida Tomato Committee, Florida Sweet Corn Exchange, South Florida Vegetable Exchange, Zellwood Sweet Corn Exchange, and North Florida Growers Exchange. Sales agencies and transportation firms provided the inputs necessary to complete the statistical story.

Foremost, the growers, shippers and processors volunteered most of the basic data used in developing these official statistics. The public spirited cooperation of these individuals and groups is appreciated.

Fieldmen James Spires, Immokalee; J. B. Joiner, Homestead; Wallace Jacobs, West Palm Beach; and S. O. Parrish, of Parrish collected much of the basic acreage, production and price statistics in this bulletin. This report was assembled under the direction of Ron Brantner and G. Norman Rose of the Florida Crop and Livestock Reporting Service and E. F. Scarborough, Bureau of Market News.

## DEFINITIONS AND EXPLANATIONS

**SEASONAL GROUPS**--During the growing season, estimates were prepared for most crops on a seasonal basis to indicate available supplies for shorter periods of time than the entire crop year. This bulletin combines the fall, winter and spring season estimates into a crop year total for all crops except potatoes. Production sold or utilized is shown by months.

**PLANTED ACREAGE** is the total acreage which has been planted for harvest during one designated season. Acreage lost and replanted to the same crop in time for harvest in the same season, is counted only once. Acreage harvested and planted again to the same crop is counted twice.

**HARVESTED ACREAGE** is the acreage partially or completely harvested. Acreage lost before or at maturity through natural or economic causes is not included in the acreage for harvest.

**YIELD** is the acreage production per acre of merchantable quality harvested and sold or utilized.

**PRODUCTION** is the quantity actually harvested and sold or utilized.

**ECONOMIC ABANDONMENT** is that portion of the crop that reached maturity and was of merchantable quality but was not harvested because of labor shortages, low prices or other economic factors; or if harvested, was not sold or utilized for those reasons. Estimates of acreage and production lost because of economic reasons are difficult to define and measure, and are not attempted unless such losses become significant.

**UNIT VALUE** for fresh market sales is the equivalent price received on an f.o.b. shipping point basis and encompasses all grades and sizes marketed or utilized.

Included are packing charges, selling charges, precooling, top ice, or other costs which contribute to the value of the product at shipping point. The value per unit for quantities sold to processors is the average value paid for usable quantities, on a "delivered to plant door" basis. This value includes transportation and other normal costs incident to delivery at plant door.

**TOTAL VALUE** is the equivalent value of production sold or utilized based on the unit value. Cullage and other quantities not sold or utilized because of natural or economic factors are excluded.

**RAIL TRUCK (Piggyback)** shipments are included in the straight rail shipments shown for each crop, unless specified.

**RAIL LOAD FACTORS** represent the average number of packages per rail car based on tabulations of waybills in prior years showing the contents of each car.

**MIXED CARS (RAIL)**--Loadings by stations are pro-rated by commodities, using tabulations of waybills in prior years.

**TRUCK SHIPMENTS** are converted to equivalent carlots on the basis of predetermined load factors. A minor difference of carlot equivalents in the season total obtained by adding the monthly or weekly shipments may exist because of rounding.

**PRODUCTION AND PRICE UNIT**--The official USDA vegetable crop estimates are published on a weight basis. For this bulletin, the official estimates for most vegetable crops have been converted to the most commonly used container. The table below gives the net weight used per container and the number of containers per hundred-weight.

**PRODUCTION AND PRICE UNIT**  
Most Common Unit, Estimated Net Weight, Number of Units per Hundredweight,  
Principal Vegetable Commodities, Florida, 1971-72 Crop Season

Commodity	Unit	Est. Net Weight	No. of Units per Cwt.	Commodity	Unit	Est. Net Weight	No. of Units per Cwt.

Escarole	Crate	25	4.000	Watermelons	Cwt.	100	--

## SUMMARY OF THE 1971-72 VEGETABLE SEASON

Florida grown vegetables, melons, potatoes, and strawberries were valued at \$343.6 million for the 1971-72 crop year, up 21 percent from the 1970-71 season. The \$60.6 million increase resulted from higher yields and better prices, and is the largest single year increase of record. Both planted and harvested acreage were up slightly during the 1971-72 season.

For the second straight year, tomato production contributed most of the gain in total value with an increase of \$26.0 million. The increase in tomato value was due to both a 2,900 acre larger acreage harvested and a \$.90 increase in price. The celery season set a record year in sales. Total returns of \$37.9 million nearly doubled the low value of sales realized in 1970-71. Other crops which increased were snap beans, cabbage, sweet corn, cucumbers, eggplant, lettuce, green peppers, squash, and strawberries. Adverse weather was primarily responsible for lower dollar sales of escarole-endive, spinach, cantaloups, watermelons, and potatoes. Crops showing higher yields were cabbage, sweet corn, cucumbers, eggplant, green peppers, squash, potatoes, and strawberries. Yields were lower for escarole-endive, lettuce and spinach, while per acre production for snap beans, celery and tomatoes were essentially unchanged from the previous season.

All crops with the exception of escarole, watermelons, potatoes, and strawberries registered increases in prices last year. The largest price increase was registered by celery which gained nearly 95 percent while the greatest decline was for escarole which lost 18 percent.

Conditions in early August were generally favorable for planting and early crop development. Rainfall was adequate to excessive in most areas. Heavy rains north of Dade County helped raise the water tables which were below normal levels. Temperatures through mid-September were generally below normal but favorable weather in late September continued into October. Scattered showers occurred during the month with some locally heavy. Temperatures were generally above normal. Overall field conditions were good.

The first week of November had average temperatures from 3-6 degrees above normal. Rains of 1/2 to 2 inches fell in most areas with the West Palm Beach station recording 10-1/2 inches. The season's first cold spell hit the State on November 11, with below freezing temperatures in North Florida and cool temperatures in the peninsula. Another cold front invaded the State around the 20th with minimums of 30-40 degrees in northern sections.

Rainfall on December 2 ranged from 1-1/2 to 5 inches in the North and Central sections with considerably less in the Southern areas. The State Climatologist

recorded December as the warmest since 1931.

Unseasonably warm weather continued during January, and like December, it was officially the warmest in 30 or more years. Cold air passages during the month were brief. Average daily temperatures dropped 20 degrees in two days in early January. Scattered frost occurred in North and West Florida on the 7th. A second front dropped temperatures into the upper 30's in Central Florida on the 17th. Scattered but locally heavy thunder storms occurred January 22nd.

The first half of February was on the cold side with heavy rains early in the period. Temperatures on the 3rd were below freezing in the North and North Central areas but winds prevented frost. Favorable weather during February 14-18 was halted by cold, hard winds on February 19. Winds of 30-40 mph, gusting to 55 mph, halted planting and harvest and caused heavy losses of new plantings, as well as wind burn and whipping of older crops. Blowing muck dust in the Everglades lowered quality of leaf crops for several weeks. Lowest temperatures of the season occurred in peninsular areas on the 21st. Frost was general except on the East Coast.

During March, temperatures slipped into the 30's on the 6th and 10th, with some light, scattered frost on the 10th. Rain and hail hit the East Glades section of Dade County on the 5th. Strong winds the 11th and 12th occurred in Ft. Myers-Immokalee and Everglades areas. A succession of squall lines beginning on the 28th preceded the passage of another cold front on March 31st with high winds, heavy rains, thunderstorms and several tornadoes.

Temperatures for April remained generally above normal even with the near weekly passages of cold fronts. Early month rains of 2-4 inches fell in most sections except the South Central and Lower East Coast. Windy, cool weather passed through the State on the 8th and 9th. Palm Beach County had heavy rains April 29-30 with up to 6-9 inches in some East Palm Beach fields. The Everglades sweet corn crop was particularly affected as 1-9 inches of rain caused too-rapid maturity at the May harvest peak.

Numerous thundershowers occurred during May. Nearly 4-1/2 inches of rain fell along the Lower East Coast from May 13-19. Alachua County received locally heavy rainfall in excess of 5 inches in late May.

Early June temperatures were on the cool side with some record lows being set in the northern stations. On June 17-19 rains spinning off Hurricane Agnes totaled 5 inches or more in the North and West, sharply reducing the late-season watermelon crop in these areas.

Much of the weather data was supplied by ESSA and the Frost Warning Service.

## SNAP BEANS 1971-72

Production of bush and pole beans in Florida totaled 4.3 million bushels during the 1971-72 season, up from the previous two crop years, but still below earlier season levels. An increase in acreage accounted for the gain as the average yield of 118 bushels per acre was unchanged from the previous season.

The average f. o. b. price of \$4.62 was the second highest of record; second to the \$5.09 received in the 1969-70 season. The favorable return per bushel boosted the total value of sales to a record \$19.7 million, which was a 9 percent increase over 1970-71.

Snap bean supplies are available from September through June with monthly volumes relatively steady from November to May. Unseasonably warm weather during December and January resulted in a very rapid maturity. In contrast to normal, volume during 1971-72

was significantly heavier in February and March and lighter in April and May.

Florida's snap beans are grown in all vegetable areas except the East Central and Southwest. Pole beans are primarily grown in the Dade County area, with small acreages also grown in the West and West Central areas. The Southeast, with 87 percent of the harvested acreage, is the major producing area, with continuous supplies throughout the season.

Wet weather adversely affected September plantings and November harvest in Pompano, with some acreage lost. Snap bean crops sustained some damage from cold winds in mid-January and again in mid-February. Heavy rains in early April caused severe damage to crops in Broward County and resulted in some lost acreage.

## CABBAGE 1971-72

Florida growers of cabbage harvested 7.6 million sacks and crates during the 1971-72 season which sold for \$15.7 million. This gross f. o. b. value is the second largest of record, exceeded only by the 1969-70 crop which returned \$16.0 million on 23 percent less production. Although the 19,100 acres planted was the highest since 1960, and 2 percent more than that of the previous year, heavy acreage losses resulted in only 17,600 acres harvested, the same as the previous year. Yields were improved, however, with the 430 crate average being the best since the 1968-69 season. The average f. o. b. price of \$2.08 per crate was up from the \$1.92 of the previous year, but well below the \$2.73 average for the 1969-70 season.

Movement during the heavy January-April period was the most stable in recent years, with monthly production totals varying no more than 300,000 crates.

The Hastings area, with 50 percent of the State's harvested acreage, produced 44 percent of the total volume. The North Central area ranked second with 4,460 acres or 25 percent of the total acreage. Favorable yields provided this area with 28 percent of the State's

total output. South Florida growers harvested the best yields in the State, averaging 535 crates per acre.

Planting of seedbeds was underway in early August with transplanting starting at Hastings as early as late August. However, it was mid-September before many growers were underway. Shower activity was variable. Some early cabbage at Hastings was adversely affected. Rain curtailed harvest at Hastings and in the North Central area in early December. The record breaking warm weather during December and January was not too desirable. Heavy fog, high humidity and high temperatures increased disease problems in some sections. Black rot was especially troublesome, causing much of the acreage loss. No appreciable damage resulted from the cold which swept the State January 15-17 and again in early February, bringing the first brief freezing temperatures to Central Florida. By May 1, the long period of heavy weekly supplies was over and all areas were in seasonal decline. Late March rains reduced May prospects but most areas furnished good quality into mid-May, particularly Flagler County in the Hastings area and North Central sections which normally harvests later than other areas of the State.

## CANTALOUPS 1971-72

The production of cantaloups in Florida reached a record low level during the 1971-72 season. The 600 acres planted, while down slightly from recent years, are well below seedings of ten years ago. Total production during 1971-72, at 35,000 hundredweight, was down 10 percent from the previous year. The season average price of \$7.99 per cwt. was the best in several years.

Cantaloups are grown in all areas of the State except the Everglades. Most of the production is sold

through local markets in bushel containers. Southmost areas furnish most of the May production while Central, North and West Florida provide the predominant June marketings.

Beginning in 1972-73, publication of estimates for Florida cantaloups will be discontinued. Acreage, production and value will be included with "Other vegetables and melons."

CELERY  
1971-72

The 1971-72 celery season in Florida is best described as outstanding. While the acreage harvested, yield, and production were about normal, excellent prices resulted in a record total value of 37.9 million dollars, which came close to doubling the 1970-71 returns. F.o.b. prices were very favorable from the beginning of the season through February, resulting in an average price of \$4.94 for the season, which was almost double the previous year and the best since the 1957-58 season.

The Everglades, with 82 percent of the harvested acreage, is the principal area of production throughout the season. The North Central area (including Island Grove) with 15 percent of the acreage also furnishes continuous supplies throughout the season. Sarasota provides the balance of the production, cutting usually from January into May.

Seeding of plant beds was active in May, with first plants set to fields in the Everglades during the last week of July, and beginning in the Zellwood area a week later. All of the crop is transplanted. Scheduled plantings continue in the Everglades through March, with the North Central area transplanting through April. The Sarasota crop is planted weekly, October through early February.

Harvest began during the last week of October and

supplies reached good volume in time for the Thanksgiving Day demand. Yields remained low during the record warm month of December but increased to a good level in January, continuing through mid-April. The warm winter weather speeded maturity in all areas with some Everglades plantings harvesting 10-14 days ahead of schedule during the winter months. The warm temperatures made disease control more difficult, but quality was generally maintained and sizes continued good throughout the season. About 8 percent of the planted acreage was not harvested, which is about the normal rate of abandonment.

State-wide, the production of celery was generally steady most of the season with production from December through May varying no more than 2-3 percent each month. Cutting declined seasonally during the latter half of May with June supplying only 5 percent of the total production. Final loadings were made during the first week of July.

Celery is subject to a Federal marketing order administered by the Florida Celery Committee. Their field supervisors provide acreage and production data. In cooperation with the Committee, these data are assembled into weekly and monthly reports to the participating industry.

SWEET CORN  
1971-72

Florida, the largest sweet corn producing State, marketed 10.9 million crates during the 1971-72 season. This production was up 3 percent from the previous year and was the largest outturn in a decade or more. Favorable weather most of the season resulted in excellent yields, averaging 195 crates per acre for the State. Growers harvested 55,700 acres which was down 9 percent from the huge 1970-71 crop, but about equal to other recent years.

Favorable prices during the fall and winter months resulted in an average f.o.b. return of \$2.71 per crate, which was up from the \$2.63 of the previous year but below the \$2.86 average for 1969-70. The favorable production and price resulted in a record value of sales of \$29.5 million. This value made sweet corn the third ranking vegetable crop, contributing nearly 10 percent of the total return for all vegetables, potatoes and melons.

First plantings of the season began July 30 in the Everglades for an October 3 harvest start. Pulling reached full stride in mid-October but rains reduced November loadings. The East Coast, which began seeding during the week of September 20 was furnishing volume by December. Record warm temperatures during December were conducive to rapid growth and maturity. January harvesting ran well ahead of schedule. Weekly shipments almost doubled

during the first week of February but volume dropped sharply as the first cool weather of the season slowed harvest. Cold, strong winds on February 19 caused considerable loss of young crops, especially in the Everglades. Some mature corn was blown over in the Pompano area. Weekly loadings continued steady at a lower level until early April when the Everglades spring harvest began, more than offsetting the phase-out of the East Coast deal.

The Everglades appeared to be heading for a well-spaced spring harvest until heavy rains April 29-30, ranging from 1-9 inches hit the area. While many fields stood in water for a considerable period, dry-back was not too severe. In addition to harvest delays, the wet soils caused very rapid maturity and large ear size, which resulted in some passed acreage because of over-maturity and a severe bunching of acreage. Peak movement occurred during the first three weeks of May but shipments continued heavy as the Zellwood harvest got underway. Zellwood increased to full volume by mid-June but heavy rains at mid-month slowed harvest and limited late season production which was completed by early July.

Small acreages furnished supplemental volume at Zellwood during the early fall, at Ft. Myers during the winter, and at Sarasota in the spring.

## CUCUMBERS 1971-72

The 15,900 acres planted during the 1971-72 crop year in Florida were down 5 percent from the 16,800 planted the previous year. However, harvested acreage increased by 3 percent from 14,100 to 14,500. The average yield of 232 bushels per acre while up sharply from the past three seasons was close to the average of earlier years. The increase in harvested acreage and yield gave a total production of 3.4 million bushels, up 27 percent from the 1970-71 season. The total value of production, at \$14.5 million was an increase of 31 percent over the \$11.0 million realized in 1970-71. The average value per bushel of \$4.31 was the highest return per bushel since the 1968-69 season.

Over 80 percent of the total production was marketed during the fall months of November and December, and the spring months of April and May. Production during January-March is very light. Recorded shipments moving out-of-state are primarily off-shore and truck imports re-sold in mixed loads.

The production of cukes is well distributed across

the State. The Southwest area, with 39 percent of the harvested acreage during 1971-72, furnished 40 percent of the total volume. The West Central area boosted plantings in 1971-72 to 26 percent of the total, and provided almost one-third of the State's output. Adverse weather in both these areas reduced stands in late-season acreage.

Heavy rains and cold winds had considerable effect on the 1971-72 crop. Early September rains delayed plantings in the Southwest and West Central areas. Some acreage in the Southeast area around Pompano was replanted after losses from heavy rains in November. Strong winds in mid-January caused considerable leaf burn in the Southwest area and resulted in replanting hardest hit acreage. Cold, strong winds and frost during the latter half of February reduced stands in many young fields. Some were replanted. Hardest hit was the West Central area with the Southwest and Pompano areas also losing some of their younger acreage.

## EGGPLANT 1971-72

Florida's production of eggplant during the 1971-72 season totaled 1.05 million bushels. This was an increase of 9 percent over the 1970-71 production despite a 6 percent decline in harvested acreage. Offsetting the decline in acreage was a 17 percent increase in yields from 511 to 597 bushels.

Plantings of 1,800 acres during the year was 70 acres less than the 1970-71 crop. Both planted and harvested acreage continued to decline, with planted acreage down significantly from the 2,900 acres planted during the 1960-61 season.

Total crop value for the 1971-72 season, at \$3.3 million, was up 21 percent from the previous crop year. Both increased production and better prices contributed to the gain in total dollar sales. The season average f.o.b. price of \$3.12 was 11 percent more than in 1970-71 but was still well below the \$3.62 realized

during the 1969-70 crop year.

In contrast to 1970-71, production sold last year was relatively stable from November through May. Record warm temperatures during December and January were very favorable for winter quarter production. Loadings during February-March were more than double those of the previous two seasons.

The Southeast area around Pompano leads in harvested acreage with 64 percent of the total. The North area is second with 12 percent; followed by Southwest, 10 percent, North Central and West Central 7 percent each. The West Central area harvested 50 percent less acreage this year than last, a decline of 130 acres. Also harvesting less acreage were the North and North Central areas. Offsetting these declines were increased plantings in the Southwest and Pompano areas.

## ESCAROLE-ENDIVE 1971-72

The total production of escarole and endive (including chicory) during the 1971-72 season totaled 3.5 million crates, 2 percent more than in 1970-71 and the largest crop in several years. The 7,900 acres harvested were 16 percent more than the previous year and the largest since the 1965-66 crop year. Sharply lower yields, averaging 440 crates for the season, limited the increase in production expected from the larger plantings. Prices were generally favorable throughout the marketing period. The season average f. o. b. price of \$1.86 was down sharply from the previous year's average of \$2.23 but compares favorably with other recent years. The total value of sales, at 6.4 million, was down 15 percent from the previous year's record returns of \$7.6 million.

The Everglades, which increased its share of the total planted acreage to 77 percent, began seeding in late August, and continued weekly planting schedules through most of March. First cuttings began at mid-October and supplies were continuous through May. The Zellwood area, with 19 percent of the planted acreage, was also in production at mid-October but plants for very limited harvest during the January-March period. Smaller acreages

grown on the Lake Placid and Sarasota mucklands furnish supplemental supplies during most of the crop year.

Supplies reached good volume in November, in time to meet the Thanksgiving demand. Harvest was active in December in the Everglades muck, with the Zellwood harvest shifting to the warmer sandlands. Record warm temperatures in December and January caused crowding of harvesting schedules in January and resulted in some passed acreage. The warm temperatures also increased disease problems.

On February 19, cold, heavy winds caused some leaf burn and considerable blowing of muck dust. Harvest was delayed, some recent plantings were lost, and quality was reduced by the dust. By mid-March, the Everglades had cut out of most of their muck-dust problems but volume continued moderate. In early April, the North Central spring harvest was increasing but volume from the Everglades was down because of the planting losses. The Everglades and Sarasota harvests declined to a mid-May completion with harvest at Zellwood continuing until early June. The advanced harvest of spring crop plantings resulted in the lightest May and June volume in several years.

## LETTUCE 1971-72

Florida's lettuce growers combined increased acreage, favorable yields, and excellent prices into a highly successful season. The total production of 605,000 hundredweight was up 5 percent from the 576,000 cwt. harvested during 1970-71, making these the largest two seasons since the mid-fifties. A record season average f. o. b. price of \$10.80 resulted in a record value of sales which totaled \$6.5 million, and was up 42 percent from the previous year's record of \$4.6 million.

Acreage, production and value statistics for lettuce in this bulletin combined the various types into a single estimate. These types include the predominant Iceberg and Romaine, as well as Boston, Bibb and leaf.

The Everglades mucklands, with 72 percent of the planted acreage, is the major source of continuous supplies. The North Central area, with 18 percent of the planted acreage is the other major producing area. The Sarasota and Lake Placid mucklands also contribute supplies much of the season.

Seeding was underway by September 1 and was active in all areas by mid-month. Scheduled weekly plantings continued through March. The Everglades, Sarasota and Lake Placid mucks are planted for continuous supplies from November through May. The North Central muckland normally drops out of production from mid-December until mid-April with limited mid-season supplies grown on the warmer sandlands.

Light harvest started at Zellwood in early October with first cuttings of Romaine starting in the Everglades in late October. Sarasota and Lake Placid followed in early November. Supplies of all types were increasing in November to good volume in early December. The record warm weather in December and January resulted in very rapid growth and maturity, and increased disease problems. Cold, high winds on February 19 caused production to drop sharply in the following weeks. Total production for February was below normal and the March volume was sharply below February for the first time in several years. Supplies continued to decline in April and were very light after May 1.

## OTHER LEAFY VEGETABLES 1971-72

Florida furnishes a substantial part of the total U. S. supply of several leafy commodities for which estimates are not published. Most of these items move through marketing channels in mixed carlots, both rail and truck. While these commodities are labeled miscellaneous for statistical purposes, they contribute significantly to the State's total production of vegetables. Chinese cabbage, curly and plain parsley, and watercress

are major contributors in this group.

The Everglades is the predominately producing area for most leafy crops except watercress which is produced mostly at Oviedo. The North Central area also furnishes a good volume seasonally with other mixer commodities. Lesser acreages are grown in the Sarasota, Ruskin and Lake Placid areas, mostly for in-state markets.

PEPPERS  
1971-72

During the 1971-72 season, producers combined excellent yields with reduced plantings to produce 5.0 million bushels, which was up sharply from the previous two seasons.

Growers harvested 12,800 acres during the season as reduced plantings in the Southwest and Pompano areas more than offset acreage increases in Central and North Florida. While adverse weather heavily reduced spring crop stands in the Southwest area, record warm December and January temperatures boosted winter yields, which resulted in a season average yield of 388 bushels per acre, the best since the 1967-68 season.

Prices were generally favorable throughout the season and fairly stable from month-to-month. The average \$4.58 per bushel for the season resulted in a total value of sales of \$22.8 million which was 28 percent more than in 1970-71, and the second largest return in a decade.

Planting was underway in all Central and Southern

areas during August. Mid-September rains caused considerable replanting in most areas. The North Central area loaded a few Cubanelles and bell pepper at mid-October to begin the fall season, and all areas were in production by the first week of November. Central area crops were phasing out by early December as the Pompano area advanced toward peak fall production and supplies from the Southwest area continued to increase. Due to the unseasonably warm weather, plantings scheduled for February were harvesting as early as January 10.

Cold, high winds and blowing sand on February 19 took their toll and all areas were replanting in late February. Young stands in the Southwest area were reduced up to 50 percent. The Pompano and Southwest areas provided a second peak level of supplies during March but phased out rapidly in early April. The Central areas were in good volume during May. Alachua County and other northern acreages were increasing in late May to an early June peak, making final pickings in late June as heavy rains ended the season.

POTATOES  
1971-72

Production of Irish potatoes in Florida during the 1972 winter-spring season at 4.6 million hundredweight was 5 percent less than the previous year, 22 percent less than the 1970 production, and down a very significant 37 percent from the 7.3 million hundredweight in 1969. Acreage harvested at 32,600 was down 10 percent, which contributed to the lower production, resulting partly from low yields.

Yields the last two years have been very light because of adverse weather. Average yields of 141 and 134 cwt. for the past two years were low, compared with 162 cwt. in 1970 and 180 cwt. in 1969. The total value of sales at \$15.8 million was the lowest since 1963. A sharply lower average FOB price as well as reduced production contributed to the lower total return for the crop.

The South Florida winter crop is predominantly red-skinned varieties grown for table stock sales. The spring crop, principally at Hastings, is planted heavy to whites which move mostly as chip stock. White B's and creamers are utilized for canning and freezing. White-skinned varieties are grown primarily under contract to chipping firms, brokers and organizations. The remainder moves to the chip stock trade through open market sales. A large percentage of the potatoes moving to proc-

essors were loaded bulk, usually without washing. About 84 percent of the total crop moves to destination by truck.

While South Florida plantings are classified as "winter", harvest continued into early May. Replanting was quite heavy following excessive rains December 22-24 and again on January 1-2. Rot of seed pieces was severe. These delays extended the planting season until about January 22, about three weeks later than usual. Poor stands in fields not replanted, plus infestations of blight contributed to the sharp drop in yields.

At Hastings, recurring rains delayed planting, which was not completed until around March 10, about a month behind schedule. The rains caused some replanting. Some fields not replanted had reduced stands. Frost and gusting winds in late February and early March adversely affected crop progress. Blight infestations reduced yields on a sizeable acreage. Harvest was active through most of May with final diggings continuing until mid-June.

"Other spring" areas had variable yields. Some record high yields were obtained in north and west Florida but wind and frost took their toll in some central plantings. Harvest of late-plantings continued through June.

SPINACH FOR PROCESSING  
1971-72

Production of spinach in Florida during the 1971-72 season was the lowest of record. The 2,000 tons delivered to processors was about 1/3 of the previous year's production and well below the 13,000 ton levels recorded in the mid-sixties.

While planted acreage at 2,200 acres was the heaviest seeding since 1967, more than 1/2 of the acreage was lost during the record warm winter season. Poor plant growth and heavy cullage reduced yields on the acreage harvested. The production shortage resulted in

a price of \$56.20 per ton which gave a total crop value of \$112,000 delivered.

Record high temperatures during December and January in the Orange and Lake County producing areas resulted in substantial replanting, poor plant condition and excessive weed growth. The first weed killing frost occurred on February 21, with harvest past peak. The acreage remaining for harvest into March was mostly weed-free, but only in fair condition.

SQUASH  
1971-72

The production of squash in Florida has held fairly constant during the past ten years, although acreages have shown considerable fluctuation. During the 1971-72 season, a total of 1.4 million bushels were produced, a 7 percent increase over the 1970-71 season, but about equal to the production levels of 5 years ago and 10 years ago. In recent years growers have combined improved yields with fewer plantings to maintain generally steady production levels. The 152 bushel average per acre during 1971-72 was about "average" for the past five years.

While f.o.b prices were generally above average throughout the season, excellent returns per bushel during the spring months boosted the season average to \$5.54, the highest of record. Total f.o.b. returns, at \$7.5 million, were also at a new record level, up 25 percent from the previous season, and almost double the total value of sales realized in the early 1960's.

Florida produces acorn, butternut, yellow crookneck, yellow straightneck, white, and zucchini squash. Dade County, with almost a 1/3 of the harvested acreage during 1971-72, produces yellow crookneck almost ex-

clusively. The Pompano area, in addition to being a major producing area, is also an important outlet for squash grown in other areas of the State, especially when local supplies reach low levels during the winter months. The Southwest area produces continuous supplies of most types of squash, while the Central areas and North and West Florida furnish good volumes of most types during the fall and spring shipping seasons.

Squash is one of the few crops in Florida shipped every month of the year. Summer movement, however, is generally light and is mostly to local markets. During the 1971-72 season, supplies were moderate and increasing through October and November, to a peak fall level during December. Volume was moderate and declining during January, to a mid-season low reached in late February. Production began increasing during March as first "spring" plantings began harvest in southern areas. Volume continued to increase during April as supplies from the West Central area more than offset the seasonal decline in Dade County. Spring volume was at a peak level during the last half of April and the first half of May, with all areas of the State in production. Loadings were very light after June 1.

STRAWBERRIES  
1971-72

Florida's strawberry growers produced 2.0 million flats of berries during the 1971-72 season, a 14 percent increase over the previous year, and the largest crop since the 1965-66 season. Planted acreage, which declined rapidly during the mid-sixties, has held steady in recent years. The 1,600 acres in production during 1971-72 was unchanged from the previous year. Growers have combined improved yields with fewer plantings to maintain a good level of production. A record yield of 1,219 flats per acre was attained during 1971-72. This yield was up substantially from the 1,073 flats per acre recorded the previous year and a third better than other recent years. The average f.o.b. return per flat, at \$3.24, was down from the previous season but was about "average".

Laying of plastic and other field preparation was active in September in the West Central and Dade County producing areas. First plants were set to fields in Dade during the last week of September while the West Cen-

tral area start followed about 10-14 days later. Planting continued active into November with all areas setting plants. Transplanting was essentially completed by November 20 in the southern areas and about a week later in most North Florida fields. Bloom was abundant in early December and light harvest had begun in both Dade and Hillsborough Counties by Christmas.

Supplies were increasing in early January, but continued warm weather reduced berry size. Yields were also lowered by labor shortages, especially in Dade. Supplies were lighter in February following an "early season" peak at mid-January. Dade County reached full volume by early March but sizes continued small. The Bradford County start during the first half of March helped boost Hillsborough and Dade Counties' volume to peak seasonal level during the latter part of March and the first half of April. Picking declined sharply in late April and was essentially completed by May 1.

## TOMATOES 1971-72

Total production, valued at \$105.2 million for the 1971-72 season, increased by 33 percent over the \$79.2 million for 1970-71. The \$26.0 million gain was the largest yearly increase for any of the 12 previous crop years. Contributing to the increased value were gains in both the f.o.b. price and total production. The season average price for fresh market sales increased 20 percent over last year to \$4.80, while the price for processing at \$.51, was virtually unchanged.

Total production in equivalent 30-lb. cartons increased from 21.8 million in 1970-71 to 23.6 million in 1971-72, an increase of 8 percent. Of the total, 21.7 million cartons were for the fresh market while an equivalent 1.9 million were for processing. Plantings increased by 1,400 acres in 1971-72, to 44,400. There were 43,600 acres harvested, 2,900 acres more than the previous year. Yields increased from 536 to 541 hundredweight per acre. The 7 percent increase in acres harvested contributed most to the increased production, since average yield was essentially unchanged.

Monthly sales were heaviest in December and May with 19.2 and 19.7 percent, respectively. Volume during February and March of 1972 was considerably heavier than

in recent years as record warm temperatures in December and January accelerated planting schedules and crop maturity.

Dade County continued to lead the State in harvested acreage with 19,200 acres. The Palmetto-Ruskin area was second, followed closely by the Ft. Pierce-Pompano and Southwest areas. A small acreage of ground crops was grown in the West, North and North Central areas.

Excessive wet weather in September caused some damage and delayed plantings and early crop development in the Southwest area. Other areas were also affected, but to a lesser extent. Record warm temperatures during December and January hastened fruit maturity, resulting in smaller fruit sizes. The warm temperatures also accelerated plant growth in seed beds. Transplanting ran ahead of schedule from 2 to 4 weeks. Cold, strong winds at mid-February caused extensive damage. The North Central, and Palmetto-Ruskin areas were the hardest hit with some acreage lost. Damage in other areas generally consisted of leaf burn, bloom drop, and fruit scarring. Winds in early March caused additional damage to plants in the Palmetto-Ruskin area.

## WATERMELONS 1971-72

Florida continued as the Nation's leading producer of watermelons in 1972, despite a sharp reduction in production from the previous year. While the planted acreage of 61,200 acres was up 17 percent from 1971, growers realized the lowest average yield since 1960. Total production of 6.7 million hundredweight in 1972 was down 10 percent from the previous year and was the lowest output since 1962. Low prices late in the season reduced the season average to \$2.42, which placed the total value of the crop at \$16.3 million, down 20 percent from 1971 and the lowest return since 1968.

The watermelon season usually starts in the Ft. Myers-Immokalee area around April 1 and progresses through Central areas during May. North Florida furnishes heavy June marketings. West Florida's harvest begins in June and continues well into July.

Seeding was off to a good start in December as record warm weather prevailed. Early plantings were emerging in late December as planting activity increased. Continued warm weather in January caused rapid crop progress and earliest fields were setting melons on February 1 for an unusually early harvest start of about March 10. Cold, high winds on February 19, however, caused considerable leaf burn and rolling of vines. The Southwest crop was set back 7-14 days and considerable re-

planting was necessary in the West Central district. Seeding was active during March in northern counties and continued into April in West Florida.

The Southwest area made first cuttings of crown melons during March 13-20, almost a month earlier than usual. Early season demand was dulled, however, by lingering cold and snow in eastern and northern markets. Heavy rains on March 31 caused severe wilt in many fields and some acreage was lost. The damage reduced melon size, and April volume from the Southwest area was well below normal expectations. In the West Central area, which centers at Arcadia and Wauchula, the set and sizing of melons was favorable during April and a good volume moved from the area during May as the Southwest deal phased out. The State's volume continued to increase during June as harvest progressed into the northern counties.

Peak seasonal movement was reached at mid-June as weekly interstate carlot movement from North and West Florida totaled 2,600 or more carlots weekly. Late June loadings were reduced by heavy, damaging rains spinning off Hurricane Agnes, which caused considerable damage to the remaining crop. Some acreage and much of the late season tonnage was lost. Light volume continued until mid-July.

1/ A small quantity, probably trial shipments, were reported for the following commodities from origins other than those shown in the tables: Cucumbers - Dominican Republic, El Salvador and Jamaica; Eggplants - Mexico; Okra - Panama and Costa Rica.

NOTE: Pompano Interstate Shipments of Mexican produce imported through Arizona and Texas border points, 1971-72 Crop Year: Beans - 2 carloads; Cucumbers - 85; Eggplant - 6; Okra - 9; Peppers - 9; Squash - 17; Tomatoes - 12; Total - 140 carloads. This data have not been previously reported in the above tables. There was an additional amount of Mexican produce brought into Florida for sale within the state, especially tomatoes for Jacksonville and Tampa repackers.
